Data Warehousing and Mining

**Course Unit Code**
Integrated Course

**Name of Lecturer**
Meltem Eryılmaz

**ECTS- Credits**
0,5

**Assessment**
Written Exam, homework, attendance

**Mode of Delivery**
Face to Face

**Prerequisites**

**Course contents**
The objectives of this course are to introduce and describe data warehousing steps and methods for accessing and analyzing warehouse data; and to introduce the basic concepts and rule mining techniques and develop skills of using recent data mining software for solving practical problems.

Data warehousing fundamentals, planning, design and implementation and administration of data warehouses, data cube computation, OLAP query processing; fundamentals of data mining and relationship with data warehouse and OLAP systems; association rule mining; algorithms for clustering, classification and rule learning.

**Recommended or required reading**

*Note: This course can be choosen from Bachelor and Master students.*

Summer Semester 2020
A revolution is currently taking place in the automotive sector before our very eyes. In addition to new drive systems, it is above all digitalization that is becoming increasingly important, both in the vehicle itself and in the surrounding road infrastructure. Innovative IT solutions allow vehicles to communicate both with each other and with their environment, thus opening up countless possibilities for making future mobility safer, more environmentally friendly and more efficient. Technologies like these include intelligent assistance systems, self-driving cars and systems for networking road users with their environment, but also mobility-based services (e.g. UBER) will fundamentally change our understanding of mobility in the coming years.

The degree program Automotive Computing trains experts for precisely these, still very young, specialist areas. The rapid development of the industry already requires specialists who understand the interplay between information technology and mobility, who can apply this optimally and thus help to shape our future sustainably.

**Name of Lecturer**

Bachelor

**Prerequisites**

Courses: Introduction to Programming, Object-oriented Programming, Algorithms and Data Structures

**Course contents**

One focus of the module is the teaching of comprehensive knowledge of the basic technologies JavaScript, CSS and HTML and the corresponding development environments. Another cornerstone is the communication of the possible applications of corresponding web apps in the area of the modern IT infrastructure (IoT, progressive web apps, ...) both in terms of content and structure, taking into account the advantages and disadvantages. It is also important to take account of current trends in new technologies, frameworks (such as Sass, Bootstrap, React, Ember, AngularJS) and application domains.

**Recommended or required reading**

5. Ater T.: Building Progressive Web Apps: Bringing the power of native to the browser, O'Reilly UK Ltd., 2017
Communication and Knowledge Media

KWM

The Internet in all its facets offers a variety of possibilities and opportunities, be it in terms of communication, collaboration, network or further education – independent of time and location. As a marketplace for information, innovation, services, and products, the Internet has become an integral part of modern economies and societies. Consequently, and in view of ever-growing digitalisation efforts, we are facing numerous apps, platforms and social networks, with new ones emerging every day.

To stay successful in an increasingly digital future, companies and organisations have to meet these new challenges. Therefore, they depend on experts, who are not only proficient in technology, but master skills that go way beyond technical expertise. Such experts are able to understand and actively shape communication, learning and working processes.

Graduates from this study programme are characterised by exactly these qualifications. Their training consists of competences from both social and computer sciences – a unique combination complemented by generic skills such as communication, cooperation, problem solving, project management, and design thinking. This set of abilities enables them to approach new media holistically and promote communication and knowledge transfer within the digital world.

</table>

**Prerequisites**

A sound knowledge of English, a minimum of B2-level

**Course contents**

In this course you will learn how to effectively deliver elevator pitches and how to talk shop proficiently. In addition, a number of grammar-related topics are covered (gerund, conditionals, adjectives).

**Recommended or required reading**

Exploiting the unlimited opportunities in the field of digital media requires mastery of creative design, smart contents, and fluency with the latest technology. This unique, full-time degree programme provides you with the technical expertise as well as the design and communication skills to take on any challenge in your chosen area – be it on the Web, in multimedia, 3D modelling, animation, computer games, audio & video production, or cross-publishing. You will acquire a solid grounding in the theory and practice of digital media. Hands-on experience with professional equipment will provide you with the technical and creative skills for implementing innovative and exciting media projects.
Writing for the Media

**Course Unit Code**
MTD172

**Type of Course Unit**
Integrated Course

**ECTS- Credits**
2

**Name of Lecturer**
Jeremiah Diephuis

**Assessment Methods and Criteria**
Continuous Assessment

**Mode of Delivery**
Face to Face

**Prerequisites**
A former student says: I liked this course a lot, it was not very technical. The main technologies used in this course were how to construct and analyse a story. You do not need any special knowledge, just read many books.

**Course contents**
The course focuses on writing and presenting for different contexts in the media industry. Story analysis and development, screenplays, Interactive Storytelling, Game Design and an overview of careers in the media industry are addressed.

**Recommended or required reading**

## Prerequisites

A transcript must be provided to select courses in this area. The professor will review and decide whether to approve participation in the course.

## Course contents

Development of concurrent and distributed algorithms, synchronization of threads, network programming (sockets, multiplexed IO, asynchronous IO). Basics of game programming, architecture of games and interactive applications, introduction to game physics and artificial intelligence for games.

## Recommended or required reading
Computer Graphics 2

**Course Unit Code**
MTD262
CGR2

**Name of Lecturer**
Michael Haller

**Type of Course Unit**
Integrated Course

**ECTS- Credits**
4.5

**Assessment Methods and Criteria**
Homework & Project

**Mode of Delivery**
Face to Face

**Prerequisites**
Ability to read simple computer programs written in the C/C++ language and a basic knowledge of computer graphics concepts (for example, depth buffering, transformations etc.). No previous experience writing graphics applications is required.

Computer graphics application programmers who might be creating a computer game, a visualization program, or other interactive application that renders to an image or a computer monitor.

**Course contents**
This course provides an accelerated introduction to programming OpenGL, emphasizing the most modern methods for using the library. In recent years, OpenGL has undergone numerous updates, which have fundamentally changed how programmers interact with the application programming interface (API) and the skills required for being an effective OpenGL programmer. The most notable of these changes, the introduction of shader-based rendering, has expanded to subsume almost all functionality in OpenGL. This course builds from demonstrating the use of the most fundamental shader-based OpenGL pipeline to introducing numerous techniques that can be implemented using OpenGL.

**Recommended or required reading**
Recommendations by former exchange students: I liked this course, it was not too technical. We mainly used OpenGL and Visual Studio. A presentation has to be prepared by the students.
Generative Arts

Course Unit Code: MTD272
Name of Lecturer: Leo Lass
Assessment Methods and Criteria: Oral or Written Examination
Mode of Delivery: Face to Face
Prerequisites

Type of Course Unit: Integrated Course
ECTS- Credits: 5

Course contents
Use of algorithmic / procedural techniques for the synthesis of audio-visual objects. Dealing with current data flow programming environments that gradually introduce basic objects and their functionality using specially developed tutorial patches, implementation of MIDI controllers, synthesizers and real-time audio effects, interaction of audio and video in terms of complex media installations, use of creative input devices such as game controllers for controlling audio / video applications.

Commentary from a past student:
“The course gives a general introduction to generative art... The class ... chose to do a larger project. For this project, it is open to the student to choose which software/technologies he/she uses... Generative Art itself is basically programming, but in a much more fun way... It’s creative programming, so there is always a direct outcome to see/hear.” ... The students projects included: a room with invisible walls and if you touch them, sound is generated, different kinds of music/ sound visualisation, live projection mapping, a synthesizer that is controlled with your face expressions, procedural trees.

... I really really really liked it (it was one of my favourite classes). It was a nice opportunity for me to dive into this world, where programming and design/art are mixed together.”

### Prerequisites
Sound knowledge of CSS, jQuery, HTML and JavaScript

### Course contents
Advanced JavaScript Concepts, like
- prototypal inheritance
- closures
- JavaScript Event Loop
- Promises
- ES2015 and later standard

Features and APIs of HTML-5, like:
- Native Audio/Video Integration
- Canvas / 2D
- Data Storage
- Offline Web Applications (Caching)
- Geolocation
- Messaging/Workers
- RealTime (WebSockets)
- Web Components

Frontend Frameworks for Single Page Applications, like Backbone.js

**Prerequisites**

A transcript must be provided to this course

**Course contents**

The course “Usability & Interaction Design” deals with the design, creation and evaluation of interface concepts. It has a strong focus on visual interface design strategies and practices. Students will create sketches, mock-ups, and low-fi prototypes that aim at specific user groups. Topics such as HCI (human-computer interaction) basics, user experience design, prototyping and other special aspects in HCI will be covered.

What students say about this course: “You will learn the techniques for designing websites and games.”

**Recommended or required reading**

Information technology today covers all aspects of the best healthcare provision. It has a crucial role in identifying the causes of illness, developing new drugs, and improving medical interventions. Graduates of our full-time degree programme will be equipped to develop and deploy software medical doctors and molecular biologists need to fulfill highly complex tasks. Expertise in informatics, data science, life sciences etc. is highly sought after worldwide, not only in the health sector, the pharmaceutical industry and molecular-biological research, but also across the IT sector. After their first year, students choose to specialise in either medical informatics or bioinformatics.

## Prerequisites

## Course contents

Primarily—but not exclusively—by means of simulations, role plays, group work, pair work, presentations, research, debates, as well as video and audio work important elements of grammar will be reviewed, technical and general vocabulary skills will be expanded, and idiomatic expressions will be introduced. All this should lead to an improvement in each student’s oral and written communication skills. Some of the areas of topicality include job application documents, job interviews, and current bioinformatics issues as well as those from other areas.

</tbody>
</table>

## Prerequisites

## Course contents

The skills acquired in the module English for Communication will be combined with those from the module Technical English to improve each student's written and oral communication skills. Each student will choose a topic from the realm of bioinformatics, create a PowerPoint presentation for it, and deliver it; this will be followed by a group discussion of the content as well as feedback for the speaker. In addition, each student will critique one presentation in writing, and the instructor will do all of them via audio or video analysis. The areas of topicality include a short review of presentation techniques, rhetorical expression, pitfalls during a presentation, and critique writing.

## Recommended or required reading
It is obvious that smartphones and other mobile devices have become an integral part of our daily lives, enabling us to stay in touch with the digital world no matter when or where. However, the underlying technologies usually stay hidden for the users. What counts is the user experience (UX): Are the applications comprehensible and easy to use? Do they run stably? What happens in the case of a weak internet connection?

At the same time, our devices are getting more powerful. The increasing number of sensors, interfaces and specialized processors open up unprecedented possibilities for many different areas, such as Artificial Intelligence, Mobile Health and Games to mention just a few.

Students of Mobile Computing acquire in-depth knowledge of communications technology, informatics and programming. Special focus is put on application development for mobile devices.

### Name of Lecturer
Jens Krösche

### Assessment Methods and Criteria
Oral or Written Examination

### Prerequisites
Students attending this course must have -- at least -- basic knowledge of object oriented programming using Java.

### Course contents
Based on a sound Java knowledge, this course will deal with the development of applications for mobile devices. As the main Java-based mobile platform Google’s Android will be the target platform for the lecture. Students will learn what aspects are needed and what tools are used to create Android applications. On this behalf multiple topics like application components, UI aspects, persistency, connectivity, localization/sensors, and distribution are discussed and trained in different examples. The lecture is evaluated based on a small prototype that needs to be designed and programmed by the students at the end of the lecture.

Taking into account the current Android version, the development of smartphone applications is discussed based on the following topics:
- Activity 1, Resources, View/Layout/Interaction, Context, Sensors, Manifest, Intent, Notification, Inter-Component Communication
- Activity 2, Fragments, ActionBar 1, Multimedia 1, Receiver, MultiTasking, Location 1, Service 1, AppWidgets, Animation

What students say about this course: “We mostly used Android studio and Java. You should have some experience with Java beforehand. In this course you will learn to build an app from zero.”

## Prerequisites

## Course contents

Based on the fundamental concepts of using and designing databases, the classic relational databases and SQL are treated first. In the context of the design of concrete relational databases (MySQL, Oracle, ...), aspects such as normalization, constraints, views, joins or transactions are treated, for example. Appropriately, tools such as ODBC and JDBC are presented, which allow access to the data of a database via programming interfaces.

In addition to classic relational databases, alternative concepts for data management, such as object-relational databases, NoSQL-DB, cloud or alternative online storage, are taken into account during the course.

## Recommended or required reading

Course Unit Code: PRO 1/3/5
Type of Course Unit: Elective Course
ECTS- Credits: 6

Name of Lecturer: Coordinator: Stephan Selinger

Assessment Methods and Criteria: 
Mode of Delivery: Face to Face

Prerequisites:

Course contents:
A modern and practical education is very important for us. Not only that enterprises value this fact, but also students often found a company themselves after or even already while their studies. Projects are therefore a good place to implement their own ideas as well as carry out interesting R&D projects and cooperations with companies.

In “Project 1” students do first steps in planning and implementing projects. This is the reason why not only the realization of the project, but also techniques of project management for a smooth working process in the team as well as tools for a flawless technical implementation are taught and learned.

Recommended or required reading:

Summer Semester 2020

34
Software is at the heart of information technology (IT), and all applications – whether for mobile phones, PCs or even modern cars – depend on instructions based on specially written programmes. This Bachelor's degree programme provides a thorough grounding in the theory and practice of sophisticated software development, including relevant tools, methodologies, and teamwork and networking skills. Graduates will be equipped to not only develop but also implement, evaluate and adapt software at the cutting edge of all areas of application. After their first year, full-time students can choose between two key areas in which to specialise: Business Software or Web Engineering. Part-time students specialise in Web Engineering.

Modelling Methods for Software Engineering

Note: This course does unfortunately not take place in Summer Semester 2020.

In 2017, the world was generating 2.7 billion gigabytes of data per day. And by 2020 forecasts say this figure could exceed 44 trillion gigabytes per year. This veritable flood of data harbours invaluable know-how that is just waiting to be accessed. Structuring the information, identifying patterns and applying the findings in a fast, efficient way is crucial for decision-making in a multitude of sectors ranging from biomedical research to finance and manufacturing. The curriculum of this Master's degree focuses on various areas in data analytics and computer science, including statistical methods, machine learning, data mining and visualisation. Students also acquire expertise in their chosen pathway: biomedical data analytics or data analytics for marketing and production.

### Name of Lecturer
Stephan Winkler

### Prerequisites
Secondary school certificate in Mathematics (A-levels), programming knowledge

### Course contents
The following topics are addressed in the lectures: Basics of modeling, linear and nonlinear systems, continuous and discrete modeling and simulation, modeling of biological systems and processes; deterministic simulations and stochastic simulations; Monte Carlo methods; population dynamics; predator prey models; models for the progress of epidemical diseases; compartment models: pharmakokinetiks, one-compartment-models, two-compartment-models, kinetiks of insulin; analysis of biosystems: haemodynamics, cardiovascular systems simulations; controlled systems; gas exchange models in lungs; classification of models and computer simulations.

### Recommended or required reading

*Note: This course can also be chosen from Bachelor students if they meet the prerequisites.*
The courses in the Master’s Programme of Biomedical Informatics are in general held in German, but upon request they can be held in English. Please send your Transcript of Records together with your Learning Agreement to check whether you have the necessary prerequisites to be able to participate in a course of our Master’s Programme “Biomedical Informatics”.

Visual Analytics/LVA-Leiter: Gerald Lirk

Datenakquisition und -qualität/LVA-Leiter: Susanne Schaller

Computational Intelligence/LVA-Leiter: Stephan Winkler

Datenvisualisierung/LVA-Leiter: Thomas Schwarzl

Scientific Working/LVA-Leiter: Thomas Schwarzl

2 ECTS, 4. Semester

Structure and functions of forms of scientific working: protocol, report, thesis paper, master’s thesis. Techniques of scientific working: scientific material; research (e.g. in libraries, catalogues, with publishers and in bibliographies; pyramid schemes, retrieval strategy); Techniques of presentation; abbreviations; reference list; conceptual planning; time management, material, presentation, programs for literature administration.
Communication and Knowledge Media

KWM

Online media is now central to corporate communication strategies and life-long learning, and keeping abreast of Internet development is of crucial importance. Meeting the challenge of web technological innovation is essential for command of the global knowledge society, and demands not only intercultural competence but also expertise in knowledge management. Our full-time, interdisciplinary Master’s degree programme equips students with exactly that mix of skills, combining social sciences, media studies, web design and web programming. A wide range of elective modules allows further specialisation in the following areas: communications, web, learning and/or organisations.
## Intercultural Online Collaboration

<table>

<td>Face to Face</td>
</tr>
</tbody>
</table>

### Prerequisites

English level should be B2 or above

### Course contents

Theories and core concepts of intercultural communication processes are taught with accompanying reflection. The contents are supplemented by examples and experiences from practical application areas as well as exercises for the further development of generic key competences. On the basis of concrete case studies, intercultural negotiation and dialogue skills are practised and analysed. Students gain knowledge about the functioning of local and distributed work teams and the adequate use of media in different communication situations. Further contents are: Models of computer mediated communication. Virtual team building, trust, workflows, communication hierarchies, roles, self-management, dealing with conflicts. Conception, planning and development as well as coordination, support and further development of an (online) community from the perspectives of people, organisation and technology. Strategies and principles of active building and further development of (online) communities: design dimensions of communities, design principles, life cycle of communities and adequate activities for the community. Special attention is also paid to the topics: Organisation of knowledge in different communities, assessment of community activities and results as well as their impact on community activities and special features of virtual vs. face-to-face communities, technical implementation variants of the community concept.

**Assessment Methods and Criteria**

**Mode of Delivery**
Face to Face

**Prerequisites**

**Course contents**

After successful completion of the course...
- ...the students received a general overview of the nature of Digital Transformation (DT) and its current and predicted effects on their own lives and work,
- ...students have an overview of technological developments relevant to DT and their effects on everyday life and the world of work,
- ...the students have developed a differentiated view of the implementation of digitisation ideas, which includes the different success factors in the concrete environment (e.g. Disruption vs. Evolution),
- ...the students know the different drivers behind the DT as well as the respective hurdles,
- ...the students know best practices for digitization projects in different industries and markets,
- ...the students know a number of methods for dealing practically with the requirements of complex and dynamic digitization projects.

Energy is the underlying heartbeat of the global economy – a critical factor in the production of nearly all goods and services in the modern world. Clearly, given the critical role of energy, the driving imperatives in any economy are ensuring security of supply, maintaining competitiveness and overseeing the transition to a low-carbon future.

Key requirements in this respect are the strategic management of supply and improving its overall generation and distribution. Impacting on these challenging goals will be a variety of factors, including advances in renewables, e-mobility and green technologies, to name only a few. Managing this changing environment is no easy task. That will require intelligent IT solutions and therefore well-educated IT experts able to design and/or operate future smart grids, smart city infrastructures and enhanced energy supply systems.

Energy Informatics is the application of information technologies to this highly demanding field and the focus of this English-taught Master’s degree programme.
## Energy Generation, Distribution & Storage

## Course contents

Terms and definitions in IT security, introduction into network security and cryptography and security aspects of Industrial Control Systems as well as an introduction into Smart Grid Security. Protection targets and security objectives, threads in IT security, cyber threads and thread analysis, introduction into risk management methods (topics, methods and standards like ISO 31000 and NIST SP300-80). An introduction into information security management (topics, methods and Security Standards like ISO 2700x family and BSI Grundschutz) and business continuity management. Additionally relevant international frameworks and models, like:

- Austrian Cyber-Security-Strategy (in German) (ÖCS, 2013, BKA, BM.I, BMLVS)
- Cyber-Security Risk Analysis (in German) (KSÖ, BM.I, 2011)
- Austrian Programme for Critical Infrastructure Protection (AP-CIP, 2008, BM.I)
- NIST Cyber-Security Framework (NIST-Guidelines for Smart Grid Cyber Security)
- NIST Guideline to Intrusion Detection and Prevention Systems
- NESCOR Guide to Penetration Testing for Electrical Utilities
- Schweizer IKT-Risikoanalyse will be discussed.

### Prerequisites

### Course contents

- Types of electrical cars: Full electric vehicles, hybrid systems.
  - Basic topologies
  - Comparison of electric and combustion engine concepts
  - Dominant energy consumption effects
  - Environmental impact
- Influence on carbon dioxide balance with respect to power generation and life cycle, nitric oxide impact, noise aspects.
  - Electrical drives
  - Basic drive concepts (motor types, wheel hub concepts), energy efficiency aspects.
- Battery systems
- Operational behaviour, lifetime aspects, range aspects, future technologies.
  - Auxiliary consumers in cars and aspects of consumption decreasing
  - Air condition, defroster, lighting, etc.
  - Safety aspects
  - Electrical arcs, battery safety.
  - Charging aspects
- Normal charging, quick charging, load feedback and harmonics problems, smart grid integration concepts.

### Recommended or required reading
IT systems of the future will need to instinctively respond to user needs and competencies. This cutting-edge, part-time degree programme gives graduates of information technology studies the chance to refine their skills in developing more accessible and user-friendly technologies. The interdisciplinary curriculum draws primarily on social sciences and IT, including areas such as interaction design, natural-user interface development, image processing, as well as prototyping. Graduates will learn problemsolving and full-spectrum consultancy skills that are key to the conceptualisation and deployment of practical applications in this dynamic field.
Augmented Reality

Name of Lecturer

Christoph Anthes

Assessment

Methods and Criteria

Project and oral exam

Prerequisites

Programming skills are required.

Course contents

Augmented Reality describes the enhancement of the real environment with virtual computer generated content. The real world has to be observed and measured to determine the position and orientation of the display. Basics of computer vision and computer graphics provide the basis for AR applications. Additional requirements are appropriate interaction techniques as well as the adaptation of the virtual content on the real world.

The course consists of two parts – the fundamentals, algorithms and applications will be presented in the theoretical part. Additionally a practical part will focus on topics like Unity development, usage of AR hardware and programming with an AR software package. The practical components are important for the final project, which has to be handed in after the completion of the course.

The goal is to teach the interested student the technology and the creation of successful AR applications. The students should be able to develop AR applications for mobile devices and the HoloLens on their own.

Recommended or required reading

- Schmalstieg, D. & Hollerer, T., Augmented Reality: Principles and Practice, Addison-Wesley Professional, 2015
- Bimber, O. & Raskar, R., Spatial Augmented Reality -- Merging Real and Virtual Worlds, A K Peters LTD, 2005

Note: This course can also be chosen from Bachelor students.

Summer Semester 2020
Interactive Media

IM

The English-taught Master in Interactive Media offers a wide range of subjects focusing on the technology and engineering behind interactive media, computer games and cutting-edge online media. Graduates acquire the essential knowledge and professional skills necessary to take on innovative and complex projects in the media industry.

The programme features both a substantial project component and an extensive selection of specialized courses that couple theoretical concepts with practical experience at the highest level.

In addition to providing an industry-oriented education, the programme aims to develop graduates’ communication skills and refine their systematic approaches to problem solving.

## Prerequisites
- technical bachelor
- programming knowledge
- git
- agile team-based programming
- Linux basics

## Course contents
Home and building automation has been around for a long while. It is a viable solution for equipping of and controlling industrial buildings with lighting, HVAC, security, audio/video, and computer networks. There are also plenty of solutions starting to become viable for the consumer.

In this class, we will learn to critically reflect, assess, and employ the solutions available. We will also focus on the integration of building automation technology and develop our own creative solutions.

The class has 5 ECTS. This means that you should budget on average an amount of 180 hours of effort for this class. This is in contrast to 30 hours presence in class. It means that only a sixth of the expected hours is class time. Therefore, expect to work outside of the class approximately 5-6 hours extra for each classroom hour.

Students attending this course must have basic procedural programming skills

**Course contents**  
Introduction to (mobile) human-computer interaction and historical context; The human factor (e.g. sensors and responders, human perception and cognitive abilities, human performance); Interaction elements (e.g. input technologies, predictive text input, mental models and metaphors, modes); Designing interactive systems (e.g. user-centered design process, ideation techniques, sketching and storyboarding); Evaluation of interface designs (e.g. paper prototyping, design guidelines and principles, heuristic evaluation); Empirical research methods (e.g. designing HCI experiments, hypothesis testing, t-test); Interaction modeling (e.g. predictive models, linear prediction equation, Fitts’ law, Keystroke-Level Model).

**Recommended or required reading**

Systems Engineering 2: Real-Time and Mobility in UML

**Course Unit Code**
MC516

**Type of Course Unit**
Integrated Course

**ECTS- Credits**
5

**Name of Lecturer**
Stephan Selinger

**Assessment Methods and Criteria**
Oral or Written Examination

**Mode of Delivery**
Face to Face

**Prerequisites**

**Course contents**
Introduction to real-time systems (classification of real-time systems, worst-case execution time, scheduling, resources, real-time operating systems), modeling and simulation of real-time systems in UML, SPT profile, MARTE profile, faulttolerant systems, modeling reliability and availability in UML, architecture and design patterns for mobile and real-time systems.

Graduates possess advanced knowledge in the area of UML Modeling and in the area of Domain- Specific Languages (DSLs) with a special focus on secure, mobile and embedded systems. The knowledge of software metrics, as well as the methodical testing of software systems, completes this know-how.

#### Prerequisites

#### Course contents

Mobile Business is based on the assumption that the increasing power, functionality and pervasiveness of mobile computing devices leads to new opportunities for businesses. These opportunities include an improvement of customer service, a reduction of costs, a mobilization of the sales force, an increase of productivity in the field service, the emergence of new business models and new ways of gaining strategic competitive advantage in the marketplace. The purpose of this module is to introduce participants to the fundamental concepts, strategies and technologies associated with the implementation of mobile computing. Students will gain the ability to play an active role in the development of mobile business opportunities in the organizations in which they work. Although the emphasis is on commercial enterprises, many of the topics of this module can be applied to government agencies and non-profit organizations as well, as they also need mobile computing solutions to improve customer service, reduce costs and increase the productivity of their employees.

In order to tackle the challenges coming along with Mobile Business and to create value in the future, the following issues will have to be considered:

(i) Infrastructure remains the key driver of the business, as the marked increase in data traffic demands ever faster networks and exceeds the long-term price decline;

(ii) Next generation networks and consistently standardized IT are crucial for efficiency and success;

(iii) The mobile internet and online services present considerable opportunities for growth

(iv) Customers expect secure and universal access to all services from all devices;

(v) Cloud computing and dynamic computing offer major potential for growth;

(vi) Intelligent networks support the transformation process in industries such as energy, healthcare, media and transportation;

### Course contents

(vii) Strong positions in national competition are important to drive profitable business. According to these issues, the outline of the module is as follows:

- Maturing markets
- Saturation of mobile penetration in European markets
- Keep customers as the main challenge for MNOs
- New and more competitors Area of competition has broadened
- Facebook, Google, Microsoft and Apple are partners and competitors at the same time, in areas like:
  - Mobile operating systems
  - Search
  - Payment
  - Mobile advertisement
- Broadband for Gigabit society
- Increase of bandwidth demand
- Mobile Internet
- Growth of mobile internet business
- Digital life and work
- Online storage
- Cloud computing
- Sharing
- Digital social life
- Mobile workplace

Prerequisites

Course contents

One focus of the module is the teaching of comprehensive knowledge of the basic technologies JavaScript, CSS and HTML and the corresponding development environments. Another cornerstone is the communication of the possible applications of corresponding web apps in the area of the modern IT infrastructure (IoT, progressive web apps, ...) both in terms of content and structure, taking into account the advantages and disadvantages. It is also important to take account of current trends in new technologies, frameworks (such as Sass, Bootstrap, React, Ember, AngularJS) and application domains.

Most devices that shape our everyday lives – from computers and smartphones to coffeemakers and jet planes – depend on a guiding software code. This full-time degree programme takes graduates in practical and applied informatics to the next level. You will expand expertise in developing, implementing and evaluating high-performance software to meet the demand for an ever-expanding range of applications. Creation of high-end software is akin to building a house: you need both the skills of a craftsperson and the inspiration of an architect. This symbiotic combination is what defines the software architect. Our Master’s degree programme will empower students to become exactly that.
# Artificial Intelligence

<td>Elementary understanding of algorithmic problem solving, some programming experience. Some mathematical background in logic and basic probability is beneficial, but not required.</td>
<td>Artificial intelligence has morphed from its Sci-Fi image that sees it as the science of building humanoid systems with human-like intelligence to a down-to-earth engineering discipline firmly rooted in its foundations in mathematics and computer science. Our everyday environment is now teeming with systems that have only recently found their way from research labs to widespread public perception and use, be it in the shape of robotic systems (such as vacuum robots and self-driving cars) or software tools (such as recommender systems, navigation aids, game AI, and spoken language understanding). In this lecture series, we will cover the basic AI algorithms that form the building blocks of modern intelligent systems. These topics are   - Problem solving: basics of AI, intelligent agents, search algorithms   - Logical agents: propositional and predicate calculus, reasoning using logic, planning   - Handling uncertainty: probability theory, knowledge representation and inference in Bayesian networks and Markov chains</td>
